Abstract: Soret effects on unsteady mixed-convection heat-and-mass-transfer flow over an oscillating vertical plate embedded in a porous medium with Newtonian heating in the presence of magnetic field are studied. The governing equations, along with imposed initial and boundary conditions, are first converted into the dimensionless form and then solved using the Laplace transform technique. The numerical results for fluid velocity, temperature and concentration are graphically shown, whereas the skin friction, Nusselt number and Sherwood number are presented in tabular forms. It is observed that the fluid velocity and concentration increase with increasing values of Soret number. The conjugate parameter of Newtonian heating increases the temperature as well as the concentration and velocity distributions. It is also found that the rates of the heat-and-mass transfer increase as the conjugate parameter increases.

Keywords: Soret effects, magnetohydrodynamic flow, heat-and-mass-transfer flow, porous medium, Newtonian heating

INTRODUCTION

Recently the study of magnetohydrodynamic (MHD) flow, together with heat-and-mass transfer, has received the attention of a large number of researchers because of its diverse applications in many branches of science and technology as well in industry. Some of the important applications are found in stellar and solar structures, cooling of nuclear reactors, interstellar matter,
liquid metal fluid, power generation system, radio propagation, aero dynamics and electromagnetic material processing [1-3]. Suneetha et al. [4], for instance, studied the MHD heat-and-mass transfer flow past a vertical plate with variable surface temperature by considering the heat due to viscous dissipation. The effects of thermal radiation and chemical reaction on MHD free-convection flow past a semi-infinite inclined porous plate with variable surface temperature and concentration were studied by Uddin and Kumar [5]. The same problem was considered by Muthucumaraswamy and Valliammal [6] for an exponentially accelerated infinite vertical plate without thermal radiation effect. Recently, Nandkeolyar et al. [7] obtained an exact solution of unsteady MHD free-convection heat-and-mass-transfer flow in a heat absorbing fluid with ramped wall temperature.

On the other hand, the problem of MHD mixed-convection flow through porous media has been the subject of considerable research activity in recent years because of its several important applications such as those involving heat removal from nuclear fuel debris, drug permeation through human skin, oil flow through porous rock and filtration of solids from liquids [8, 9]. Beg et al. [10] presented exact solutions for unsteady MHD heat transfer in a semi-infinite porous medium with thermal radiation flux. In the same year, Reddy et al. [11] extended the work of Beg et al. [10] by taking into account the periodic wall temperature. The effects of thermal radiation on MHD free-convection flow through a porous medium with variable boundary conditions were investigated by Kishore et al. [12]. The effects of slip condition on the unsteady MHD flow of a viscoelastic fluid in a porous channel were analysed by Farhad et al. [13]. Recently, the influence of thermal radiation and chemical reaction on MHD heat-and-mass-transfer flow embedded in a porous medium with variable suction was studied by Ahmed and Das [14].

In all the above studies, the thermal-diffusion (Soret) effect was neglected. Thermal diffusion of great significance for isotope separation and for making a mixture of gases with very light molecular weights (H₂, He) and medium molecular weights (N₂, air) [15]. Due to the importance of thermal-diffusion effect, a number of researchers have studied it for different fluids. Ahmed [16], for instance, made an exact analysis of the thermal-diffusion effect on combined heat-and-mass-transfer Hartmann flow through a channel bounded by two infinite horizontal isothermal parallel plates. The Soret-driven, free-convection heat-and-mass-transfer flow of a non-Newtonian liquid past a vertical plate in a thermally stratified porous medium was studied by Narayana et al. [17]. Farhad et al. [18] found analytical solutions of MHD heat-and-mass-transfer flow past a vertical plate embedded in a porous medium in the presence of Soret and chemical effects. The influence of Soret effect on the unsteady motion of MHD mixed-convection flow of a viscoelastic fluid over an infinite vertical plate in the presence of a heat source was investigated by Jha et al. [19]. Sharma et al. [20] studied the Soret and Dufour effects on unsteady MHD mixed-convection flow with heat source and Ohmic dissipation. Recently, MHD heat-and-mass-transfer flow over a vertical plate in a porous medium under the influence of Dufour and Soret effects was discussed by Vedavathi et al. [21].

The mixed convection flows with combined heat-and-mass transfer past an oscillating vertical plate are usually modelled by considering the ramped wall temperature, variable surface temperature or constant surface heat-flux boundary conditions [22-24]. However, in many practical situations where the heat transfer from the surface is proportional to the local surface temperature, the above conditions fail to work and the Newtonian heating condition is needed. Merkin [25] initiated the idea of Newtonian heating in his pioneering work on natural convection boundary flow passing through a vertical surface. Applications of Newtonian heating are found in many important engineering applications, e.g. in heat exchangers where bounding surfaces absorb heat by solar
radiation and in conjugate heat transfer around fins. Considering the importance of Newtonian heating condition, many authors have used it in their convective heat-transfer problems and obtained the solutions either numerically [26-30] or analytically [31-38]. The main objective of the present study is to investigate the thermal-diffusion effect on unsteady MHD mixed-convection heat-and-mass-transfer flow past an oscillating vertical plate through a porous medium with Newtonian heating, where the heat transfer from the surface is proportional to the local surface temperature. The governing equations are solved using Laplace transform technique and the expressions for velocity, temperature and concentration are obtained in terms of exponential and complementary error functions. The corresponding expressions for skin friction, Nusselt number and Sherwood number are also evaluated.

**MATHEMATICAL FORMULATION**

Consider the unsteady mixed convection flow of a viscous incompressible fluid through a porous medium bounded by an infinite oscillating vertical plate. The x'-axis is taken along the vertical plate and y'-axis normal to it. The magnetic field $B_0$ of uniform strength is applied normal to the plate and the induced magnetic field is considered to be negligible. Initially, for time $t' \leq 0$, both the plate and fluid are at rest with constant temperature $T_\infty$ and concentration $C_\infty$. At time $t' = 0^+$, the plate starts an oscillatory motion in its plane with velocity $V$:

$$V = U_0 \cos(\omega t') i; \ t' > 0,$$

where $i$ is the unit vector in the flow direction, $U_0$ is the amplitude of the plate oscillations and $\omega'$ is the frequency of oscillation. At the same time, the heat transfer from the plate to the fluid is proportional to the local surface temperature $T'$ and the concentration near the plate is raised from $C_\infty$ to $C_w$. The geometry of the problem is shown in Figure 1.

![Figure 1](image-url)  
**Figure 1.** Physical sketch of different boundary layers in a porous medium under the effect of magnetic field, together with the corresponding Cartesian coordinates.
Under the Boussinesq’s approximation [39], the governing equations of free convection flow can be written as:

\[
\frac{\partial u'}{\partial t'} = v \frac{\partial^2 u'}{\partial y'^2} - \frac{\sigma B_o^2}{\rho} u' - \frac{\nu \phi}{k_1} u' + g \beta (T' - T_\infty) + g \beta^* (C' - C_\infty),
\]

(2)

\[
\rho C_p \frac{\partial T'}{\partial t'} = k \frac{\partial^2 T'}{\partial y'^2} - \frac{\partial q_r}{\partial y'},
\]

(3)

\[
\frac{\partial C'}{\partial t'} = D \frac{\partial^2 C'}{\partial y'^2} + \frac{D K_T}{T_m} \frac{\partial^2 T'}{\partial y'^2},
\]

(4)

where \( u' \) is the axial velocity, \( t' \) the time, \( \rho \) the fluid density, \( \nu \) the kinematic viscosity, \( \sigma \) the electric conductivity of the fluid, \( \phi \) the porosity, \( k_1 \) the permeability, \( g \) the acceleration due to gravity, \( \beta \) the volumetric coefficient of thermal expansion, \( \beta^* \) the volumetric coefficient of mass expansion, \( C_p \) the heat capacity at constant pressure, \( T' \) the temperature of the fluid, \( k \) the thermal conductivity, \( q_r \) the radiative flux along the \( y' \)-axis, \( C' \) the species concentration in the fluid, \( C_\infty \) the species concentration far away from the plate, \( K_T \) the thermal diffusion ratio, \( T_\infty \) the ambient temperature, \( T_m \) the mean fluid temperature and \( D \) the mass diffusivity.

The corresponding initial and boundary conditions are

\[
t' \leq 0 : u' = 0, \quad T' = T_\infty, \quad C' = C_\infty \quad \text{for all} \quad y' \geq 0,
\]

(5)

\[
t' > 0 : \quad u' = U_0 \cos(\omega t'/\nu), \quad \frac{\partial T'}{\partial y'} = -h_c T', \quad C' = C_\infty \quad \text{at} \quad y' = 0,
\]

(6)

\[
u' \rightarrow 0, \quad T' \rightarrow T_\infty, \quad C' \rightarrow C_\infty \quad \text{as} \quad y' \rightarrow \infty,
\]

(7)

where \( h_c \) is the heat transfer coefficient, and \( C_\infty \) and \( C_w \) are the species concentrations near and far away from the plate respectively. Using the Rosseland approximation [40], equation (3) modifies to:

\[
\rho C_p \frac{\partial T'}{\partial t'} = k \left( 1 + \frac{16 \sigma T_\infty^2}{3k^*} \right) \frac{\partial^2 T'}{\partial y'^2}.
\]

(8)

Introducing the following non-dimensional variables,

\[
y = y' U_0 / \nu, \quad t = t' U_0^2 / \nu, \quad u = u' U_0, \quad \theta = T' - T_\infty / T_\infty, \quad C = C' - C_\infty / C_\infty, \quad \omega = \omega' \nu U_0^2,
\]

into equations (2), (4) and (8), we obtain

\[
\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial y^2} - M^2 u - \frac{1}{K} u + Gr \theta + Gm C,
\]

(9)

\[
Pr \frac{\partial \theta}{\partial t} = (1 + R) \frac{\partial^2 \theta}{\partial y^2},
\]

(10)

\[
\frac{\partial C}{\partial t} = \frac{1}{Sc} \frac{\partial^2 C}{\partial y^2} + Sr \frac{\partial^2 \theta}{\partial y^2},
\]

(11)
where

\[
\begin{align*}
Gr &= \frac{\nu g \beta T_{\infty}}{U_0^3}, \quad Gm = \frac{\nu g \beta' (C_w - C_{\infty})}{U_0^3}, \quad M^2 = \frac{\nu \sigma B_0^2}{p U_0^2}, \quad K = \frac{\nu'}{k U_0^2}, \\
Pr &= \frac{\mu C_p}{k}, \quad R = \frac{16 \sigma^* T_{\infty}^3}{3 k k'}, \quad Sc = \frac{\nu}{D}, \quad Sr = \frac{DK iT_{\infty}}{\nu T_m (C_w - C_{\infty})},
\end{align*}
\]

are the Grashof number, modified Grashof number, magnetic parameter, porosity parameter, Prandtl number, radiation parameter, Schmidt number and Soret number respectively. The corresponding initial and boundary conditions in non-dimensional form are:

\[
\begin{align*}
0 : t u C y \theta &= 0, C = 0 \quad \text{for all } y \geq 0, \\
t > 0 : u &= \cos(\omega t), \quad \frac{\partial \theta}{\partial y} = -\gamma (1 + \theta), \quad C = 1 \quad \text{at } y = 0, \\
0 \to 0, \theta \to 0, C \to 0 \quad \text{as } y \to \infty.
\end{align*}
\]

Here, \(\gamma = h_r \nu / U_0\) is the conjugate parameter for Newtonian heating. It is important to note that equation (13) gives \(\theta = 0\) when \(\gamma = 0\), corresponding to \(h_r = 0\) and consequently, in this case no heating from the plate exists [27, 33].

### METHOD OF SOLUTIONS

Applying the Laplace transform with respect to time \(t\) to the system of equations (9) to (14), we obtain the following solutions in the transformed \((y, q)\) plane:

\[
\begin{align*}
\bar{u}(y, q) &= \frac{1}{2(q + i \omega)} e^{-y \sqrt{q + L}} + \frac{1}{2(q - i \omega)} e^{-y \sqrt{q + L}} + \frac{ac}{q^2 (\sqrt{q - c})} e^{-y \sqrt{q + L}} \\
&- \frac{cdh}{q^2 (\sqrt{q - c})} e^{-y \sqrt{q + L}} + \frac{bch}{q^2 (\sqrt{q - c})} e^{-y \sqrt{q + L}} + \frac{b}{q^2} e^{-y \sqrt{q + L}} \\
&- \frac{ac}{q^2 (\sqrt{q - c})} e^{-y \sqrt{q \text{Pr}_{\text{eff}}}} + \frac{cdh}{q^2 (\sqrt{q - c})} e^{-y \sqrt{q \text{Pr}_{\text{eff}}}} - \frac{b}{q^2} e^{-y \sqrt{q \text{Sc}}} \\
&- \frac{bch}{q^2 (\sqrt{q - c})} e^{-y \sqrt{q \text{Sc}}},
\end{align*}
\]

\[
\bar{\theta}(y, q) = \frac{c}{q (\sqrt{q - c})} e^{-y \sqrt{q \text{Pr}_{\text{eff}}}},
\]

\[
\bar{C}(y, q) = \frac{1}{q} e^{-y \sqrt{q \text{Sc}}} + \frac{ch}{q (\sqrt{q - c})} e^{-y \sqrt{q \text{Sc}}} - \frac{ch}{q (\sqrt{q - c})} e^{-y \sqrt{q \text{Sc}}},
\]

where \(\bar{u}(y, q) = \int_0^y e^{-y} u(y, t) dt\), \(\bar{\theta}(y, q) = \int_0^y e^{-y} \theta(y, t) dt\) and \(\bar{C}(y, q) = \int_0^y e^{-y} C(y, t) dt\) denote the Laplace transforms of \(u(y, t)\), \(\theta(y, t)\) and \(C(y, t)\) respectively, and \(a = \frac{Gr}{\text{Pr}_{\text{eff}} - 1}, \ b = \frac{Gm}{Sc - 1}\), \(c = \frac{\gamma}{\sqrt{\text{Pr}_{\text{eff}}}}, \ d = \frac{Gm}{\text{Pr}_{\text{eff}} - 1}, \ h = \frac{Sc \text{Sr}}{\text{Pr}_{\text{eff}} - 1}, \ L = M^2 + \frac{1}{K}\) and \(\text{Pr}_{\text{eff}} = \frac{\text{Pr}_{\text{eff}}}{1 + R}\) (\(\text{Pr}_{\text{eff}}\) is the effective Prandtl number) [40]. The inverse Laplace transform of equations (15) to (17) yields:
\[
\theta(y,t) = e^{(z - yc\sqrt{\text{Pr}_{\text{eff}}})} \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}} - c\sqrt{t}\right) - \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}}\right),
\]  
\[
C(y,t) = \text{erfc}\left(\frac{y}{2\sqrt{Sc}}\right) + h \left[ e^{(z - yc\sqrt{\text{Pr}_{\text{eff}}})} \text{erfc}\left(\frac{y}{2\sqrt{Sc}} - c\sqrt{t}\right) - \text{erfc}\left(\frac{y}{2\sqrt{Sc}}\right) \right]
- h \left[ e^{(z - yc\sqrt{\text{Pr}_{\text{eff}}})} \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}} - c\sqrt{t}\right) - \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}}\right) \right]
\]
\[
u(y,t) = \frac{1}{4} e^{-i\omega t} \left[ e^{y\sqrt{L - i\omega t}} \text{erfc}\left(\frac{y}{2\sqrt{L - i\omega t}}\right) + e^{-y\sqrt{L - i\omega t}} \text{erfc}\left(\frac{y}{2\sqrt{L - i\omega t}}\right) \right] + \frac{1}{4} e^{i\omega t} \left[ e^{-y\sqrt{L + i\omega t}} \text{erfc}\left(\frac{y}{2\sqrt{L + i\omega t}}\right) + e^{y\sqrt{L + i\omega t}} \text{erfc}\left(\frac{y}{2\sqrt{L + i\omega t}}\right) \right]
+ \frac{(dh - a)}{c} \left[ e^{(z - yc\sqrt{\text{Pr}_{\text{eff}}})} \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}} - c\sqrt{t}\right) - \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}}\right) \right]
- \frac{(dh - a)}{c} \left[ \frac{t}{\sqrt{\pi}} e^{-\frac{y^2 \text{Pr}_{\text{eff}}}{4t}} - y \sqrt{\text{Pr}_{\text{eff}}} \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}}\right) \right]
- \frac{(dh - a)}{c} \left[ \frac{y^2 \text{Pr}_{\text{eff}}}{2} + t \right] \text{erfc}\left(\frac{y}{2\sqrt{\text{Pr}_{\text{eff}}}} - y \sqrt{\text{Pr}_{\text{eff}}} \sqrt{\frac{t}{\pi}} e^{-\frac{y^2 \text{Pr}_{\text{eff}}}{4t}} \right)
- \frac{bh}{c} \left[ e^{(z - yc\sqrt{\text{Pr}_{\text{eff}}})} \text{erfc}\left(\frac{y}{2\sqrt{Sc}} - c\sqrt{t}\right) - \text{erfc}\left(\frac{y}{2\sqrt{Sc}}\right) \right]
+ \frac{bh}{c} \left[ \frac{t}{\sqrt{\pi}} e^{-\frac{y^2 Sc}{4t}} - y \sqrt{Sc} \text{erfc}\left(\frac{y}{2\sqrt{Sc}}\right) \right]
+ b(h - 1) \left[ \frac{y^2 Sc}{2} + t \right] \text{erfc}\left(\frac{y}{2\sqrt{Sc}}\right) - y \sqrt{Sc} \sqrt{\frac{t}{\pi}} e^{-\frac{y^2 Sc}{4t}}
+ \frac{bh}{2} \left[ e^{-y\sqrt{L}} \text{erfc}\left(\frac{y}{2\sqrt{Lt}} - \sqrt{Lt}\right) + e^{y\sqrt{L}} \text{erfc}\left(\frac{y}{2\sqrt{Lt}} + \sqrt{Lt}\right) \right]
- \frac{yb}{4\sqrt{L}} \left[ e^{-y\sqrt{L}} \text{erfc}\left(\frac{y}{2\sqrt{Lt}} - \sqrt{Lt}\right) - e^{y\sqrt{L}} \text{erfc}\left(\frac{y}{2\sqrt{Lt}} + \sqrt{Lt}\right) \right]
+ c(a - dh + bh) \int_0^t \frac{1}{\sqrt{\pi}(t - s)} + ce^{z(t-s)} \text{erfc}\left(-c\sqrt{t - s}\right)
\times \left[ \frac{s - y}{4\sqrt{s}} e^{-y\sqrt{L}} \text{erfc}\left(\frac{y}{2\sqrt{Ls}} - \sqrt{Ls}\right) + \left(\frac{s}{2} + \frac{y}{\sqrt{L}}\right) e^{y\sqrt{L}} \text{erfc}\left(\frac{y}{2\sqrt{Ls}} + \sqrt{Ls}\right) \right] ds.
\]

where \text{erfc}(.) represents the complementary error function.

Note that the above solutions for concentration and velocity given by equations (19) and (20) are only valid for \text{Pr}_{\text{eff}} \neq 1 and \text{Sc} \neq 1. Moreover, the other solutions are:
1) When $Pr_{\text{eff}} = 1$ and $Sc \neq 1$,

$$C(y,t) = \text{erfc} \left( \frac{y}{2 \sqrt{t}} \right) - \frac{ScSr}{(Sc-1)} \left[ e^{(r_1-y)\sqrt{Sc}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - \gamma \sqrt{t} \right) \right. \\
\left. + e^{(r_2-y)\sqrt{Sc}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - c \sqrt{t} \right) \right],$$

$$u(y,t) = \frac{1}{4} e^{-iat} \left[ e^{-y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - \sqrt{(L-i\omega)t} \right) + e^{y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} + \sqrt{(L-i\omega)t} \right) \right]$$

$$+ \frac{1}{4} e^{-iat} \left[ e^{-y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - \sqrt{(L+i\omega)t} \right) + e^{y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} + \sqrt{(L+i\omega)t} \right) \right]$$

$$+ \left( \frac{Gr + bScSr}{L} \right) \left[ e^{(r_1-y)\sqrt{Sc}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - \gamma \sqrt{t} \right) \right. \\
\left. - e^{(r_2-y)\sqrt{Sc}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - c \sqrt{t} \right) \right]$$

$$+ \frac{bScSr}{\gamma^2 (Sc-1)} \left[ e^{(r_1-y)\sqrt{Sc}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - \gamma \sqrt{t} \right) \right. \\
\left. - e^{(r_2-y)\sqrt{Sc}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - c \sqrt{t} \right) \right],$$

$$- \frac{bScSr}{\gamma (Sc-1)} \left[ 2 \sqrt{\frac{L}{t} e^{\frac{-y^2 Sc}{2t}}} - y\sqrt{Sc} \text{erfc} \left( \frac{y}{2 \sqrt{t}} \right) \right],$$

$$- \frac{bScSr}{(Sc-1)} \left[ \left( \frac{y^2 Sc}{2} + t \right) \text{erfc} \left( \frac{y}{2 \sqrt{t}} \right) - y\sqrt{Sc} \sqrt{\frac{t}{\pi}} e^{\frac{-y^2}{2t}} \right],$$

$$- b \left[ \left( \frac{y^2 Sc}{2} + t \right) \text{erfc} \left( \frac{y}{2 \sqrt{t}} \right) - y\sqrt{Sc} \sqrt{\frac{t}{\pi}} e^{\frac{-y^2}{2t}} \right],$$

$$+ \frac{bt}{2} \left[ e^{-y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - \sqrt{Lt} \right) + e^{y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} + \sqrt{Lt} \right) \right],$$

$$- \frac{yb}{4\sqrt{Lt}} \left[ e^{-y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - \sqrt{Lt} \right) - e^{y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} + \sqrt{Lt} \right) \right],$$

$$- \frac{ybScSr}{(Sc-1)} \int_{\sqrt{\pi (t-s)}} \frac{1}{\sqrt{\pi (t-s)}} e^{\frac{-\gamma (t-s)}{\sqrt{Lt}}} \text{erfc} \left( -\gamma \sqrt{Lt} \right) ds,$$

$$\times \left[ \left( \frac{s}{2} - \frac{y}{4\sqrt{Lt}} \right) e^{-y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2\sqrt{Lt}} - \sqrt{Lt} \right) + \left( \frac{s}{2} + \frac{y}{4\sqrt{Lt}} \right) e^{y\sqrt{Lt}} \text{erfc} \left( \frac{y}{2\sqrt{Lt}} + \sqrt{Lt} \right) \right].$$

2) When $Pr_{\text{eff}} \neq 1$ and $Sc = 1$,

$$C(y,t) = \text{erfc} \left( \frac{y}{2 \sqrt{t}} \right) - \frac{Pr_{\text{eff}} Sr}{(Pr_{\text{eff}} - 1)} \left[ e^{(r_1-y)\sqrt{Pr_{\text{eff}}}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - c \sqrt{t} \right) \right. \\
\left. - erfc \left( \frac{y}{2 \sqrt{t}} - c \sqrt{t} \right) \right]\right],$$

$$+ \frac{Pr_{\text{eff}} Sr}{(Pr_{\text{eff}} - 1)} \left[ e^{(r_1-y)\sqrt{Pr_{\text{eff}}}} \text{erfc} \left( \frac{y}{2 \sqrt{t}} - c \sqrt{t} \right) \right. \\
\left. - erfc \left( \frac{y}{2 \sqrt{t}} - c \sqrt{t} \right) \right].$$
The dimensionless expression for skin friction evaluated from equation (20) is given by

\[
C(y,t) = \text{erfc} \left( \frac{y}{2\sqrt{t}} \right),
\]

(25)

\[
u(y,t) = \frac{1}{4} e^{-\text{iu}t} \left[ e^{-y \sqrt{\text{Re}}} \text{erfc} \left( \frac{y}{2\sqrt{t}} - \sqrt{(L - i\omega)t} \right) + e^{y \sqrt{\text{Re}}} \text{erfc} \left( \frac{y}{2\sqrt{t}} + \sqrt{(L - i\omega)t} \right) \right]
+ \frac{1}{4} e^{\text{iu}t} \left[ e^{-y \sqrt{\text{Re}}} \text{erfc} \left( \frac{y}{2\sqrt{t}} - \sqrt{(L + i\omega)t} \right) + e^{y \sqrt{\text{Re}}} \text{erfc} \left( \frac{y}{2\sqrt{t}} + \sqrt{(L + i\omega)t} \right) \right]
- \frac{Gm}{2L} \left[ e^{-y \sqrt{\text{Re}}} \text{erfc} \left( \frac{y}{2\sqrt{t}} - \sqrt{Lt} \right) + e^{y \sqrt{\text{Re}}} \text{erfc} \left( \frac{y}{2\sqrt{t}} + \sqrt{Lt} \right) \right] - 2\text{erfc} \left( \frac{y}{2\sqrt{t}} \right)
- \frac{Gr}{L} \left[ e^{(\text{ci})^2} \text{erfc} \left( \frac{y}{2\sqrt{t}} - \gamma \sqrt{t} \right) - \text{erfc} \left( \frac{y}{2\sqrt{t}} \right) \right]
- \frac{Gr}{2\pi L} \int_0^t \frac{y^2}{s^\frac{3}{2}} e^{-\left( \frac{L + s^2}{4s} \right)} ds + \frac{Gr}{2\pi L} \int_0^t \frac{y^2}{s^\frac{3}{2}} e^{-\left( \frac{L + s^2}{4s} \right)} ds.
\]

(26)
\[ \tau' = \frac{\tau'}{\rho U_0^2} = -\frac{\partial u}{\partial y} \big|_{y=0}, \]

\[ = \frac{1}{2} \sqrt{L-i\omega} e^{i\omega t} \left[ 1 - \text{erfc}\left(\sqrt{(L-i\omega)t}\right) \right] + \frac{1}{2} \sqrt{L+i\omega} e^{i\omega t} \left[ 1 - \text{erfc}\left(\sqrt{(L+i\omega)t}\right) \right] \]

\[ + \left( \frac{a-dh}{c} \right) \sqrt{\text{Pr}_{\text{eff}}} \left[ 1 + e^{c^2 t} \left( -2 + \text{erfc}\left( c\sqrt{t} \right) \right) \right] + 2(a-dh) \sqrt{\text{Pr}_{\text{eff}}} \frac{t}{\pi} \]

\[ + \left( \frac{bh}{c} \right) \sqrt{\text{Sc}} \left[ 1 + e^{c^2 t} \left( -2 + \text{erfc}\left( c\sqrt{t} \right) \right) \right] + 2b(a+h) \sqrt{\text{Sc}} \frac{t}{\pi} \]

\[ + bt \sqrt{L} \left[ 1 - \text{erfc}\left( \sqrt{Lt} \right) \right] + \frac{b}{2L} \left[ 1 - \text{erfc}\left( \sqrt{Lt} \right) \right] + \frac{1}{\pi t} e^{-Lt} \]

\[ - c(a-dh+bh) \int_0^t \left[ \frac{1}{\sqrt{\pi} (t-s)} + c e^{c^2 (t-s)} \text{erfc}\left( -c\sqrt{t-s} \right) \right] \]

\[ \times \left[ \sqrt{\frac{s}{\pi}} e^{-L_s} + \frac{(1+2Ls)}{2L} \text{erf}\left( \sqrt{Ls} \right) \right] ds, \quad (27) \]

where \( \tau' \) is the dimensional skin friction. The dimensionless expression of the Nusselt number is given by

\[ \text{Nu} = -\frac{\nu}{U_0(T'-T_\infty)} \frac{\partial T'}{\partial y} \big|_{y=0} = \frac{1}{\theta(0,t)} + 1, \]

\[ = c \sqrt{\text{Pr}_{\text{eff}}} \left[ 1 + \frac{1}{e^{c^2 t} \left[ 1 + \text{erfc}\left( c\sqrt{t} \right) \right]} \right]. \quad (28) \]

The dimensionless expression of the Sherwood number is given by

\[ \text{Sh} = -\frac{\partial C}{\partial y} \big|_{y=0}, \]

\[ = \sqrt{\frac{\text{Sc}}{\pi t}} + h \left( \sqrt{\text{Pr}_{\text{eff}}} - \sqrt{\text{Sc}} \right) c e^{c^2 t} \left[ -2 + \text{erfc}\left( c\sqrt{t} \right) \right]. \quad (29) \]

**LIMITING CASES**

**In the Absence of Thermal-Diffusion Effect**

In the absence of thermal-diffusion effect, which numerically corresponds to \( Sr = 0 \), the equations (19) and (20) reduce to:

\[ C(y,t) = \text{erfc}\left( \frac{y}{2 \sqrt{\frac{\text{Sc}}{t}}} \right), \quad (30) \]
In the Absence of Mass Diffusion

In the absence of mass diffusion the solution for velocity given in equation (20) reduces to:

$$u(y,t) = \frac{1}{4} e^{-\omega t} \left[ e^{-\sqrt{L-\omega} t} \text{erfc} \left( \frac{y}{2\sqrt{t}} - \sqrt{(L-\omega) t} \right) + e^{\sqrt{L-\omega} t} \text{erfc} \left( \frac{y}{2\sqrt{t}} + \sqrt{(L-\omega) t} \right) \right] + \frac{1}{4} e^{\omega t} \left[ e^{-\sqrt{L+\omega} t} \text{erfc} \left( \frac{y}{2\sqrt{t}} + \sqrt{(L+\omega) t} \right) + e^{\sqrt{L+\omega} t} \text{erfc} \left( \frac{y}{2\sqrt{t}} - \sqrt{(L+\omega) t} \right) \right] - \frac{a}{c^2} \left[ e^{(\epsilon_1 - \sqrt{\mu_eff}) t} \text{erfc} \left( \frac{y}{2\sqrt{t}} - c\sqrt{t} \right) - \text{erfc} \left( \frac{y}{2\sqrt{t}} + \sqrt{\mu_eff} t \right) \right] + \frac{a}{c} \left[ 2 \sqrt{\frac{t}{\pi}} e^{-\sqrt{\mu_eff} \frac{y^2}{4t}} - y \sqrt{\mu_eff} \text{erfc} \left( \frac{y}{2\sqrt{t}} + \sqrt{\mu_eff} t \right) \right] \tag{31}$$

the known solutions of Hussanan et al. [33] (see equations (20) and (22)). In addition, if we take $L = \omega = 0$ and $\gamma = 1$, the solutions for temperature (18) and velocity (31) reduce to that obtained by Narahari and Nayan [34] (see equations (14) and (15)).
The effects of the magnetic field in a porous medium, the profiles of velocity are illustrated in Figure 7 for different values of $K$. The velocity increases as $Gr$ and $Gm$ are increased, because an increase in both of these parameters means increasing thermal and mass buoyancy effects, which gives rise to an increase in the induced flow. Further, from these Figures, it is noticed that the Grashof number and modified Grashof number do not have any influence as the fluid moves away from the bounding surface.

The fluid velocity profiles are shown in Figure 5 for different values of $R$. It is found that the velocity increases with increasing values of $R$ in the presence of thermal radiation ($R = 2,3,4$) as well as in the case of pure convection ($R = 0$). This is expected because higher radiation occurs when the temperature is higher and as a result the velocity increases. Effects of the magnetic parameter ($M$) on velocity are shown in Figure 6. Physically, $M = 0$ means that there is no magnetic effect and the flow is purely hydrodynamic. It is found from this Figure that the velocity decreases with increasing value of $M$. This is expected as the application of the transverse magnetic field always results in a resistance-type force called Lorentz force. This force is similar in nature to a drag force, and upon increasing the values of $M$ the drag force increases and tends to resist the fluid flow, thus reducing the fluid motion significantly. In order to visualise the velocity field in a porous medium, the profiles of velocity are illustrated in Figure 7 for different values of $K$, as the other flow parameters are kept fixed. It is observed that the velocity increases with an increase in $K$. This result may be explained by the fact that the presence of a porous medium decreases the resistance to flow and hence enhances the fluid motion. So it is confirmed from this graph that porosity has an important role in the present analysis.
Figure 2. Velocity profiles for different values of Pr, when Gr = 5, Gm = 2, R = 0.5, M = 2, K = 0.5, Sc = 0.62, Sr = 2, γ = 1, t = 0.4, ωt = π/3

Figure 3. Velocity profiles for different values of Gr, when Pr = 1, Gm = 2, R = 0.5, M = 0.2, K = 2, Sc = 0.62, Sr = 2, γ = 1, t = 0.4, ωt = π/3

Figure 4. Velocity profiles for different values of Gm, when Pr = 1, Gr = 2, R = 0.5, M = 0.2, K = 2, Sc = 0.62, Sr = 2, γ = 1, t = 0.4, ωt = π/3

Figure 5. Velocity profiles for different values of R, when Pr = 7, Gr = 5, Gm = 2, M = 0.2, K = 2, Sc = 0.22, Sr = 2, γ = 1, t = 0.5, ωt = π/3
The effects of $Sc$ on the velocity profiles are shown in Figure 8. It is observed that an increase in $Sc$ results in a decrease of velocity. Figure 9 shows that the fluid velocity increases with an increase in $Sr$. In Figure 10 the velocity profiles are illustrated for different values of $\gamma$; as the conjugate parameter increases, the fluid density decreases and the momentum-boundary-layer thickness increases, and finally the fluid velocity increases. From Figure 11, the fluid velocity increases with an increase in $t$. The velocity profiles for different values of $\omega t$ are shown in Figure 12. It is observed that the velocity shows an oscillatory behaviour: near the plate it is maximum and decreases with increasing distance from the plate, finally approaching zero as $y \to \infty$. It is clearly seen from this Figure that the velocity satisfies the given boundary conditions (13) and (14), which shows the accuracy of our results.

The effects of Prandtl number ($Pr$) on the fluid temperature are shown in Figure 13, which shows that the temperature decreases with an increase in $Pr$. Physically, this is due to the fact that with increasing $Pr$, the thermal conductivity of the fluid decreases and the viscosity of the fluid increases, and as a result the thermal boundary layer decreases. On the other hand, the buoyancy that results from the thermal expansion of the fluid adjacent to the surface causes the development of a rising boundary layer. Consequently, it is found from a comparison of Figure 2 and Figure 13 that the momentum boundary layer is thicker than the thermal boundary layer because the buoyant fluid layer causes macroscopic motion in the thicker fluid layer due to high viscosity.

The behaviour of the radiation parameter ($R$) on temperature profiles are shown in Figure 14, where $R=0$ indicates no thermal radiation. It is observed that the temperature increases with an increase in $R$. This is due to the fact that the effect of thermal radiation is to increase the thermal-boundary-layer thickness with an increase in the value of the radiation parameter $R$. From Figure 15, it is found that as the conjugate parameter ($\gamma$) increases, so does the thickness of the thermal boundary layer and as a result the temperature of the plate increases. The effects of time ($t$) on the
temperature (Figure 16) are quite identical to those on the velocity profiles, and it is observed from all the temperature profiles that the temperature is maximum near the plate and decreases away from the plate and finally approaches zero as \( y \to \infty \).

The variations in the concentration field for different values of Pr and R are shown in Figures 17 and 18. An increase in Pr decreases the concentration field, but an increase in R increases the concentration field. Further, it is found from these Figures that the effects of Pr and R on the concentration field is similar to those on the velocity. Figure 19 illustrates the effects of Schmidt number (Sc) on the concentration field: an increase in the value of Sc makes the concentration boundary layer thick and hence the concentration field decreases. The effects of Sr on the concentration field are shown in Figure 20: the concentration increases with increasing value of Sr. From Figure 21, similar effects of the conjugate parameter (\( \gamma \)) on the concentration are found. The effects of time (t) on the concentration field (Figure 22) are similar to those on the velocity and temperature fields plotted in Figures 11 and 16 respectively.

The numerical values of skin friction, Nusselt number and Sherwood number for various parameters of interest are presented in Tables 1-3. The skin friction (\( \tau \)) decreases with increasing \( t, R, Gm, Sc, Gr, K, \gamma \) and \( \omega t \), while it increases as \( Pr, Sr \) and \( M \) are increased (Table 1). The Nusselt number (Nu) increases with an increase in either \( Pr \) or \( \gamma \), while the reverse effects are observed for \( t \) and \( R \) (Table 2). From Table 3, it is observed that the Sherwood number (Sh) increases with increasing value of \( Pr, Sc, Sr \) and \( \gamma \), while it decreases with an increase in \( t \) and \( R \).

**Figure 8.** Velocity profiles for different values of Sc, when \( Pr = 3, Gr = 8, Gm = 2, R = 0.5, M = 0.2, K = 3, Sr = 2, \gamma = 0.2, t = 0.2, \omega t = \frac{\pi}{3} \)

**Figure 9.** Velocity profiles for different values of Sr, when \( Pr = 3, Gr = 5, Gm = 3, Sc = 0.78, R = 0.5, M = 0.2, K = 0.5, \gamma = 1, t = 0.2, \omega t = \frac{\pi}{3} \)
Figure 10. Velocity profiles for different values of $\gamma$, when $Pr = 1, Gr = 5, Gm = 2, R = 3, M = 2, K = 0.2, Sc = 0.22, Sr = 0.5, t = 0.2, \omega t = \frac{\pi}{2}$

Figure 11. Velocity profiles for different values of $t$, when $Pr = 1, Gr = 3, Gm = 2, R = 3, K = 2, M = 0.2, Sc = 0.22, Sr = 0.5, \gamma = 1, \omega t = 0$

CONCLUSIONS

Exact solutions of magnetohydrodynamic mixed convection flow in a porous medium with Newtonian heating condition are obtained. Laplace transform technique is used for the problem solution. Graphs for temperature, concentration and velocity are plotted and discussed. The following main points concluded from this study are:

- Fluid velocity increases with increasing radiation parameter ($R$), Grashof number ($Gr$), modified Grashof number ($Gm$), porosity parameter ($K$) and conjugate parameter ($\gamma$).
- Skin friction behaviour is opposite to that of velocity.
- Nusselt number increases with increasing conjugate parameter and Prandtl number.
- Sherwood number increases with increasing Prandtl number, Schmidt number and conjugate parameter.
